## Principle Component Analysis

Learning Type: Unsupervised, Task: Dimension Reduction, Algorithm: PCA

## **Definition:**

It is a popular technique to reduce the dimensionality/feature of the datasets. It preserves the maximum amount of information by finding new feature vectors that maximize the data spread.

**Applications:** It is used to visualize the data, find the patterns in high-dimension data, and image compression

## Algorithm of Principle Component Analysis:

Step1: Standardize the features with zero mean and one standard deviation.

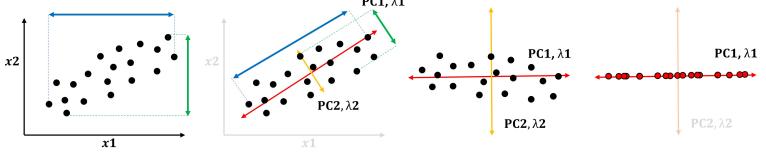

$$x_j^{(i)} \leftarrow \frac{x_j^{(i)} - \mu_j}{\sigma_j}$$
 where  $\mu_j = \frac{1}{m} \sum_{i=1}^m x_j^{(i)}$  and  $\sigma_j = \sqrt{\frac{1}{m} \sum_{i=1}^m \left( x_j^{(i)} - \mu_j \right)^2}$  (1)

where m is the number of examples in dataset X.

**Step2:** Find the covariance matrix of dataset and compute eigenvalues and eigenvectors of covariance matrix using spectral decomposition, where n is the number of features.

$$Cov(X) = \begin{bmatrix} \sigma_{x_1}^2 & \dots & cov(x_1, x_n) \\ \vdots & \ddots & \vdots \\ cov(x_n, x_1) & \dots & \sigma_{x_n}^2 \end{bmatrix} \quad and \quad Cov(X) = V\Sigma V^{-1}$$
 (2)

Step3: Sort the eigenvalues and eigenvectors in ascending order  $\Sigma_{sort} = \text{sort}(\Sigma)$  and  $V_{sort} = \text{sort}(V, \Sigma_{sort})$ Step4: Transform the dataset X to new k feature vectors  $V_{\text{reduced}} = V[:, 0:k]$  and  $X_{\text{reduced}} = X \times V_{\text{reduced}}$ 

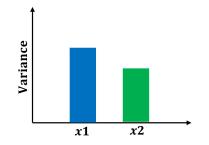

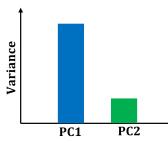

**Step1:** Standardize the data with mean 0 and std 1

**Step2:** Find  $2 \times 2$  covariance matrix then 2 eigenvalues, 2 eigenvectors

Step3: Sort PCs based on eigen value  $\lambda 1 > \lambda 2$  and select PC1

**Step4:** Map the data to PC1 vectors

- 1) The eigenvector with the largest eigenvalue is in the direction along which the dataset has the maximum variance which is called first principal component that is PC1.
- 2) Covariance matrix will be order of  $n \times n$  with n eigenvalues and n eigenvectors.
- 3)  $X_{reduced}$  will be order of  $m \times k$  where X is  $m \times n$  and  $V_{reduced}$  is  $k \times n$
